

# XML ISIR Record Layout, Tags and Data Description

The ISIR record layout/data description lists all the XML tags available for the ISIR record, provides a brief description of the field and lists valid field content for each tag. The layout is based on the 2003-04 ISIR data and will be modified as necessary for 2004-05.

- **Schema Field Number** – Enumerates all fields in this document
- **Field Number** - Lists either the CPS Header, Trailer or ISIR field number
- **03-04 ISIR Data Field** – Identifies the schema tag name, provides a definition of the field, and provides the name of the ISIR field name to which the tag maps. Some fields in the NSLDS Aid History section currently do not have a description. We will provide this information with the next update to this document.
- **Maximum Length** – Specifies the maximum length of the element
- **Data Type** – Specifies the type of field (e.g. date, integer, string, Boolean etc.)
- **Field Type** – Specifies whether the field is a simple or complex element
- **Format and Valid Field Values** – Describes the acceptable values for a given ISIR Record field

A few fields have valid values that are too many to list here, so we provided one attachment to provide what those valid values are (See Valid Field Values Attachment). Also, note that in most cases when there is a non-response to a data field, the tag/field simply will not be provided with the ISIR record sent by the CPS. “Nil” indicates that a response was initially provided but subsequently was changed to a blank response. Below are some XML-specific notes for the ISIR. They address some issues that are commonly understood among experienced XML programmers, but might not be known by those new to this technology. The information in this section is not intended to be a complete XML primer, as there are many excellent complete and detailed publications out on the subject. However, we hope that by passing along these lessons learned, this discussion will help ease XML technology-related 'growing pains'.

## XML Data Types and Field Types:

Below is an explanation of the data types and field types in this document.

### Data Types:

- **Boolean** – the value literals ‘true’ or ‘false’ (without the quotes) may appear in this field
- **Boolean (required)** – holds the same values as a Boolean, but the notation of “required” indicates that the field will always be populated with a value, it will never be absent from a student record
- **Date** – a valid date value, where the format is CCYY-MM-DD
- **DateTime** – a valid date and time value, where the format is CCYY-MM-DDTHH:MM:SS Note that the “T” in the format string is a literal, used to separate the date value from the time value.
- **Integer** – a numeric value, where the maximum number of digits is listed under the “Max Length” column
- **String** – an alpha-numeric value, including special characters as listed under “Valid Values”, where the maximum number of characters is listed under the “Max Length” column
- **String List** – also an alphanumeric value like a string. However this field has all possible values pre-defined in a list, which is indicated under the “Valid Values” column.

#### Field Types:

- Simple Element – this tag holds data, such as a boolean, string, integer, or date
- Complex Element – this tag holds other tags, to indicate a relationship in the data

#### Elements in Block Sequence:

The ISIR Record Layout lists elements in block sequence. A general rule regarding sequence of data within blocks, and within complex elements: the start and end data tags and their context must be presented on the XML document within the block's tags or the complex element tags to which they belong. The sequence of the data within that block or element is dictated by the sequence of the data tags presented in the XML schema. For example, if a complex element has ten simple elements within it, those ten elements must occur in the same sequence as depicted in the ISIR layout that follows, as well as the XML schema.

#### XML Entity References:

In XML, certain characters have special meaning for processing the tags, and therefore must be treated specially if they are needed in the content of a tag. This 'special treatment' would consist of the use of an entity reference in place of the character. The use of entity reference is standard XML practice.

An entity reference is a group of characters that are used in text to substitute for a single specific character. The characters that need this substitution are very few; they are essentially the markup delimiters in XML. Using the entity reference prevents a literal character from being mistaken for a markup delimiter. For example, if the value for an attribute must contain a left angle bracket (<), you can substitute the entity reference "&lt;". Entity references always begin with an ampersand (&) and end with a semicolon (;). The entities predefined in XML are identified in the following table:

#### Character    Entity reference

&	&amp;
<	&lt;
>	&gt;
"	&quot;
'	&apos;

An example of the use of an entity reference is as follows:

```
<AddressLine>100 Town & Country Drive</AddressLine>      <!--don't do this, it's not correct XML -->
<AddressLine>100 Town &amp; Country Drive</AddressLine> <!--do this, using an entity reference -->
```

## Batch Number Information for use with ISIR Field 116

The structure of the 23-character unique EDE batch number is as follows:

#X4ZZZZZZCCYYMMDDHHMMSS where, #X = the record type indicator, with a pound sign (#) followed by the character below to signify the record type:

A = Electronic App ISIRs

C = Correction/Duplicate ISIRs

E = Automatic ISIRs

F = Federal Data Requests ISIRs

G = CPS System Generated ISIRs

I = Year-To-Date (YTD) ISIRs

K = State Agency Non-Resident ISIRs

L = State Agency Resident ISIRs

Y = Reprocessed Records ISIRs

Z = CPS System Generated ISIRs

4 = year indicator (always "4" for 2003-2004 data)

ZZZZZZ = the 6-digit valid Federal School Code or State Agency 3 byte Code followed by 3 spaces

CCYYMMDD = the current date in century, year, month, day format

HHMMSS = the current time in hours, minutes, seconds format

Example:

A batch number of #C4E1234520030509141532 signifies a batch of 2003-2004 corrections transmitted to CPS from a school with a 6-digit code of E12345 on May 9, 2003 at 2:15:32 PM.

A batch number for a State Agency using the same example would look like: #C4IA1 20030509141532
